LESSON 1 WHAT IS PROBLEM SOLVING?

INTRODUCTION

We all encounter and solve problems daily, both in our private life and our work life. Some problems are more significant than others and warrant more attention since the implications of making a poorer decision can be much bigger.

How can a 'problem' be defined? It can be identified as something which needs attention to be resolved, this can refer to a situation, a thing, or a person. Of course, what is a problem to one person may not be to another which can cause friction.

The process of problem solving involves the definition of the problem, identifying the cause of the problem, identifying, and selecting solutions, and finally implementing a solution for resolution. The length of time that this process takes, will be based on how large the problem is.

Consider Timing and Resources

Some problems are bigger than others and the implications of making a bad decision can be exceptionally significant. When problems are complex and getting the right solution is very important; it can warrant a lot of time, effort, and perhaps other resources, to make the very best decision. Taking time to make decisions though will delay action; and in a timesensitive situation, a poorer decision made fast might be better than a better decision made more slowly.

Many decisions in both personal and work life are often made quickly, without a lot of consideration. Often the implications of a fast decision do not make a lot of difference in the grand scheme of things.

There are lots of different ways to work through solving a problem and using the right approach in each situation is a valuable skill.

Suggested Tasks: V

Throughout this course you will be provided with suggested tasks and reading to aid with your understanding. These will appear in the right hand column.

Remember: these tasks are optional. The more you complete, the more you will learn, but in order to complete the course in 20 hours you will need to manage your time well. We suggest you spend about 10 minutes on each task you attempt, and no more than 20 minutes.

LEARN MORE

Suggested Tasks

With the help of a friend or family member, brainstorm a list of problems that currently deserve your attention. For example, you might decide to consider how you could improve sustainability at home.

WHY ARE PROBLEM SOLVING SKILLS IMPORTANT?

There are many reasons why problemsolving skills have a high level of importance both within the workplace and in someone's personal life. This includes:

- Control over our environment the ability to solve problems helps us to identify opportunities, it supports the ability to innovate and think differently. This is a skill which is appreciated by organisations but also as an individual it may open avenues which without that approach would be closed off. This in turns enables a certain level of control over what is happening within our lives, both at home and in business.
- Control over our future by problem solving it is possible to make changes which can have an impact over what we are able to achieve. Considering different possibilities, weighing up alternative solutions can provide more opportunities than taking the first option.
- To fix something that is broken within our personal or business lives, there are many things that are flawed. Processes which aren't effective, activities that aren't positive for us, and things which just aren't going right. Without problem solving there is a risk that these negative aspects continue without being fixed which can have big impacts on us.
- Addressing potential risks risks are things which might happen and have a negative impact on a

business or a person. The ability to identify these risks is one thing, but finding ways in which they can be avoided is another – this is where problem solving skills come in.

- Improving performance within a business, or as an individual, there are intricate webs of relationships meaning that the way in which one person acts will often influence someone else. This interdependency on one another, allows more complex issues to be addressed and creates a culture of continuous improvement. Problem solving supports the ability to understand these relationships and adapt to change.
- Seizing opportunities if problem solving skills are held, it is much more likely that an opportunity will be recognised as the scoping skills involved help people to think differently – less one dimensional.

PROBLEM SOLVING SKILLS AT WORK, IN EDUCATION AND ELSEWHERE

The benefits that come from developing problem-solving skills are numerous and can be applied in many different circumstances. Some of these include:

Improve your CV/Resume and increase chances of promotion – more and more employers are looking for recruits who are more dynamic than ever before. The more skills that can be presented to a potential employer, the less training that they will see is required. This

Suggested Tasks

Talk to a group of work colleagues. Can they identify the 'intricate web of relationships' at work? Whose actions influence other people? Does the answer change with the subject matter? This is not always going to be a boss or line manager. makes an individual a very attractive proposition. Equally within an existing team, managers are looking for team members who can take on additional responsibilities. Often, the higher up an organisation you go, the bigger the chance that you will need to be able to react to issues and find solutions. Having those skills will make you stand out from others.

- Creative thinking towards problems

 in many challenging situations, people will need to be much more creative in finding solutions. This has changed over time as there is now an expectation that more can be done with less, i.e., the number of resources available is reduced. This requires creativity rather than considering standard approaches.
- Designing research there are many circumstances when research will need to be carried out. Whilst there are standard approaches which can be taken, there is also often the need to consider different options. This is reflected in the design of the research, working to achieve the same outcome but from a different angle or approach.
- Finding new ways to promote products – as a manager within a sector which requires sales of products and services, it is often very competitive. Problem solving skills help support people to find different ways of doing things, looking at a variety of options and exploring new approaches. A problem solver will be able to efficiently carry this process out to select an approach which is not necessarily the normal approach.

Devise projects – to fully understand a project there is an element of problem solving, getting to the route of the issue at the heart of the project can be one of the first steps i.e., identifying the reason for the project. This then becomes the basis for developing the solutions, which are also grown out of a problem-solving approach as different ideas are reviewed and evaluated.

Suggested Tasks

Discuss with a group of friends:

How do the reports you either read or write express problems or problem solving activities? Does everyone adopt the same structure and writing process? What works and what could be improved?

PROBLEM SOLVING SKILLS

Before considering solutions to problems, let's briefly consider some useful skills a problem solver can have:

- Active listening active listening is when we pay full attention to what someone else is saying. You are not thinking about your lunch, or what you are going to say next, but really listening to what someone else says. By doing this, we can ensure that we are fully informed and have the facts that they are trying to convey.
- Information gathering this refers to being able to collect data, information, and facts. It is a useful technique, knowing how to search out and find information.
- Information analysis this is being able to critically think about and evaluate information that we are given without jumping to obvious conclusions.

Whilst these are useful skills for any problem solver, not all decision makers are good problem solvers. However, ensuring that you have the right people around you to help you to decide can overcome this hurdle.

PROBLEMS OR OPPORTUNITIES?

When something happens, we must also consider whether it is a problem or an opportunity – although, of course, something can be a problem AND an opportunity. All of us encounter a vast number of problems – some small, and others large. In a workplace, managers have problems thrust onto them by subordinates, and outside work problems can be thrust onto you by friends, acquaintances, and family members. Some people are overwhelmed by problems, whilst others can have a natural inclination to want to solve every problem personally. As a problem solver, it is important to recognise that good decisions are often made by more than one person. Teamwork and collaboration are important.

There are three common ways we can deal with problems and opportunities:

1) Anticipate

We can try to avoid problems occurring in the first place:

- Identify potential problems before they arise.
- Create conditions to avoid problems arising.
- Establish contingencies to deal with problems when they arise.

A note on Contingency Planning – A Risk Assessment Process

Contingency planning is a valuable strategy for organisations who want to minimise the impact of problems on a workforce or business. It is a critical element of planning and should be worked into the core business plan.

Business continuity and contingency planning have a similar focus but over different timeframes. Business continuity

Suggested Tasks

Active Listening. Work with a friend - ask your friend to tell you about five things. These could be five things they like about themselves, five skills they have, five things they'd like to do or something else. DO NOT TAKE NOTES. When they have finished speaking, summarise what they said and repeat it back to them.

What did you notice? Was the task easy or hard for either one of you?
